

ARCHIE - Essential Software Design

November 2017

Amanda Trinh

A. Architectural Design

Introduction

ARCHIE is an iOS/Android mobile application commissioned by UCI that includes a web-based portion to view data gathered from the app's users. The app is intended to improve and enhance the current Anteater Recreational Center (ARC) application by replacing it. UCI students will be able to use the old features of the current ARC app, mainly to schedule ARC classes, along with the addition of a food journal, planning ARC events, data analysis, and a built-in social networking feature. The purpose of ARCHIE is to help UCI students become healthier by promoting fitness, healthy eating, and participating in ARC events and courses, all of which they have the ability to manage under the new application.

Table of Contents

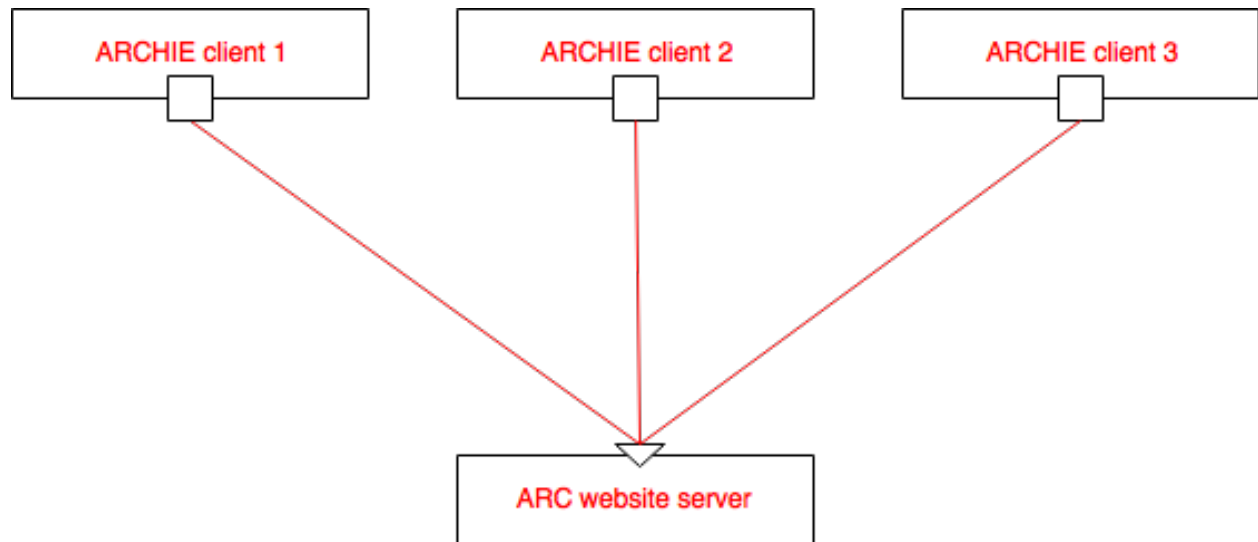

- A. Architectural Design [This Section] – Will include an Introduction to briefly explain the purpose of the ARCHIE app, along with an Executive Summary in regards to the software's features and a few "principal" design decisions chosen for the software architecture
- B. Use-case Scenarios – Details some use-cases pertaining to the ARCHIE requirements documentation on the app's features.
- C. Sequence Diagrams – Expands on the use-cases used in section B by mapping the scenarios.
- D. Class Diagram – Takes into consideration the entire system and all of the requirements and captures it into related classes.
- E. NOT REQUIRED: Collaboration Diagram
- F. NOT REQUIRED: Relational Database Diagram
- G. NOT REQUIRED: State Modeling
- H. User-interface Design – Elaborates upon the mentioned ARCHIE requirements and the software architecture/design into UI/UX designs.
 - H1. Wireframes
 - H2. Mockups

Overview / Executive Summary

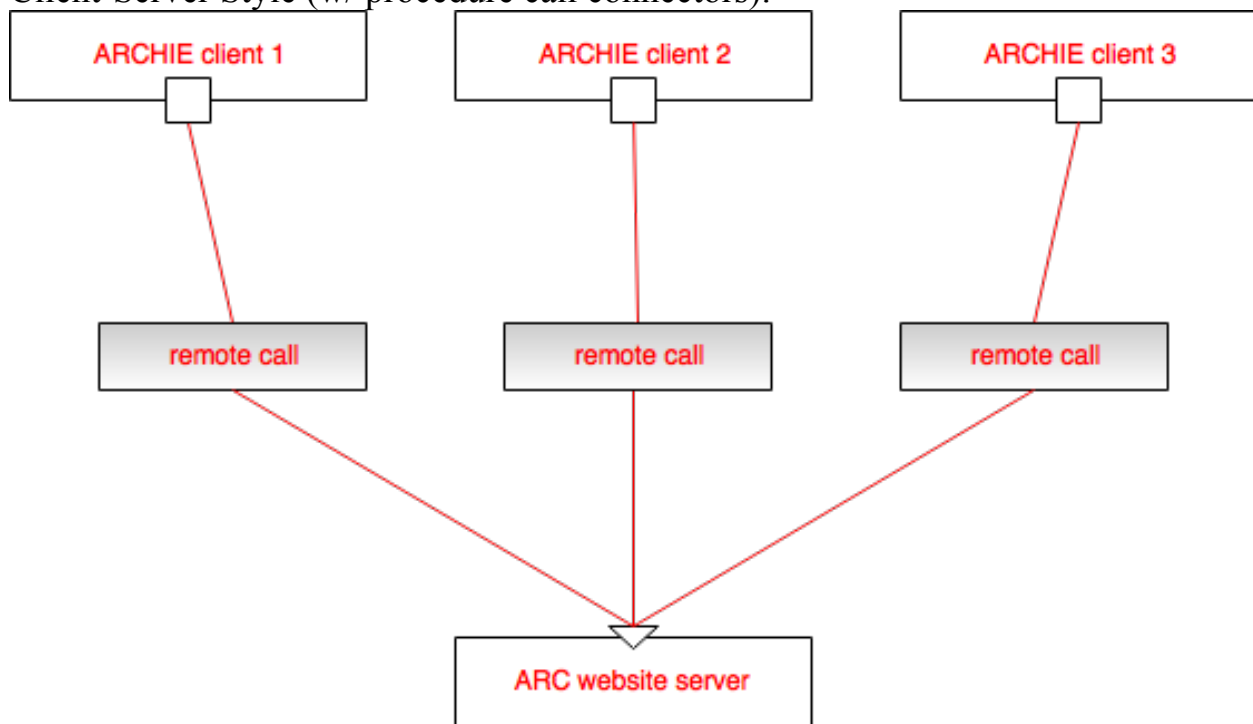

The ARC is the recreational center located on the UC Irvine campus that holds the different ARC classes and events that students can schedule within the current ARC app. ARCHIE will expand on the current features with the intent of improving students' health at UCI as the new ARC application for iOS and Android devices, along with a web-based component to the current ARC website. The main features are ARC Class Scheduling, ARC Event Planning, Food Journaling, Fitness Tracking, Data Analysis, and a Social Network.

One of the app's architectural styles, for example, in regards to the Data Analysis feature, will be a client-server style between the ARCHIE app and current ARC website; The Data Analysis feature of ARCHIE is the anonymous data collected by the app's fitness step-tracker and food journal that will be aggregated and viewed separately on a new page that will be found on the current ARC website.

Client-Server Style (using Data Analysis example):

Client-Server Style (w/ procedure call connectors):

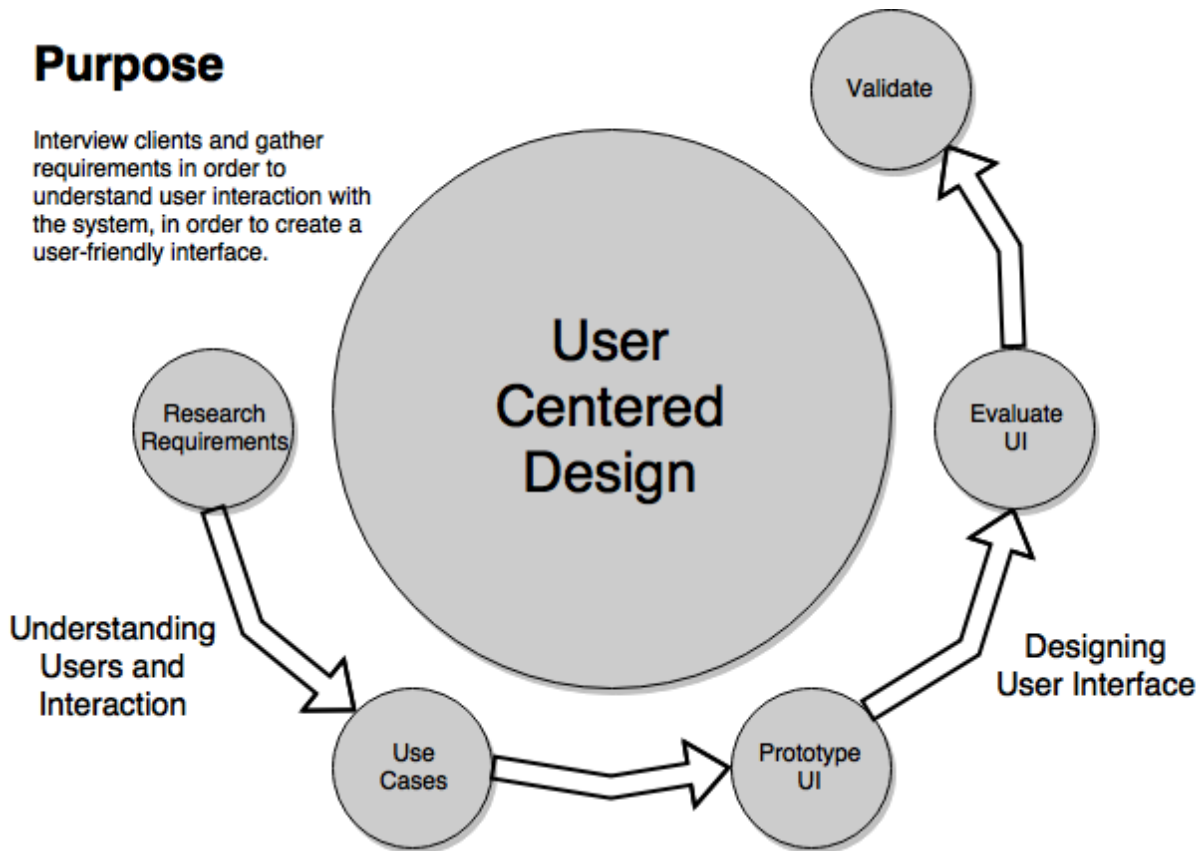

The software will take a three-tiered approach, where the process of accessing the app's different data and main features can be done either with or without an internet connection. This will also support the user-focused design for the user interface, where usability is a central part on the implementation and execution of the system.

Three-tiered Pattern:

The three-tiered pattern shows how the application can remotely run its main features and store user data between the mobile device and ARCHIE app when it is not connected to the Internet, but it can also upload data and retrieve other user data, ARC courses, etc. by accessing the “back tier” when connected to the Internet for full functionality access.

User-focused Design (or User-Centered Design):

B. Use-case Scenarios

1) UCI Students: Add Friend
Example: Persona

Jasmine Lee

Age: 20

Residence: Costa Mesa, CA

Major: Neurobiology

Occupation: Full-Time, Undergraduate Student

- She's been in a soccer club since middle school and now plays weekly in her area
- Lives at-home but often goes out to meet up with friends from her soccer team, most of whom also currently attend UCI
- Previously did not use the ARC app but is excited about the potential social aspect of ARCHIE
- Prefers to keep her workout and soccer life in tandem so she can't wait to see how the new system will allow her to connect with her teammates
- Very sociable and loves working on projects or having fun in groups
- Passionate about working out, almost as much as science

Example: Scenario

- Jasmine has just finished practice with her soccer team and is in a rush to change and go home to finish up a project due that night
- She remembers that she still has to do some muscle and agility training with some of her teammates at the ARC
- She pulls out her phone and asks her friends if anyone is interested in working out at the school gym this week
- They say yes and she quickly tells them to check ARCHIE later to schedule everything
- She realizes they aren't friends on the new app yet, but she loves how she can quickly add them all later that night
- She was able to add her friends quickly and was also able to schedule everything from the place to time all within the app
- She loves how the app also allows her to keep her fitness life separate from her other, more personal social life.
- She finds the ability to add new teammates and workout buddies, along with scheduling events, much easier through the app since she never has to leave it to text or message her friends through multiple means.

2) UCI Students: Export Event to Facebook

Example: Persona

Anthony K. Allen

Age: 22

Residence: Irvine, CA

Major: Sociology

Occupation: Full-Time, Graduate Student

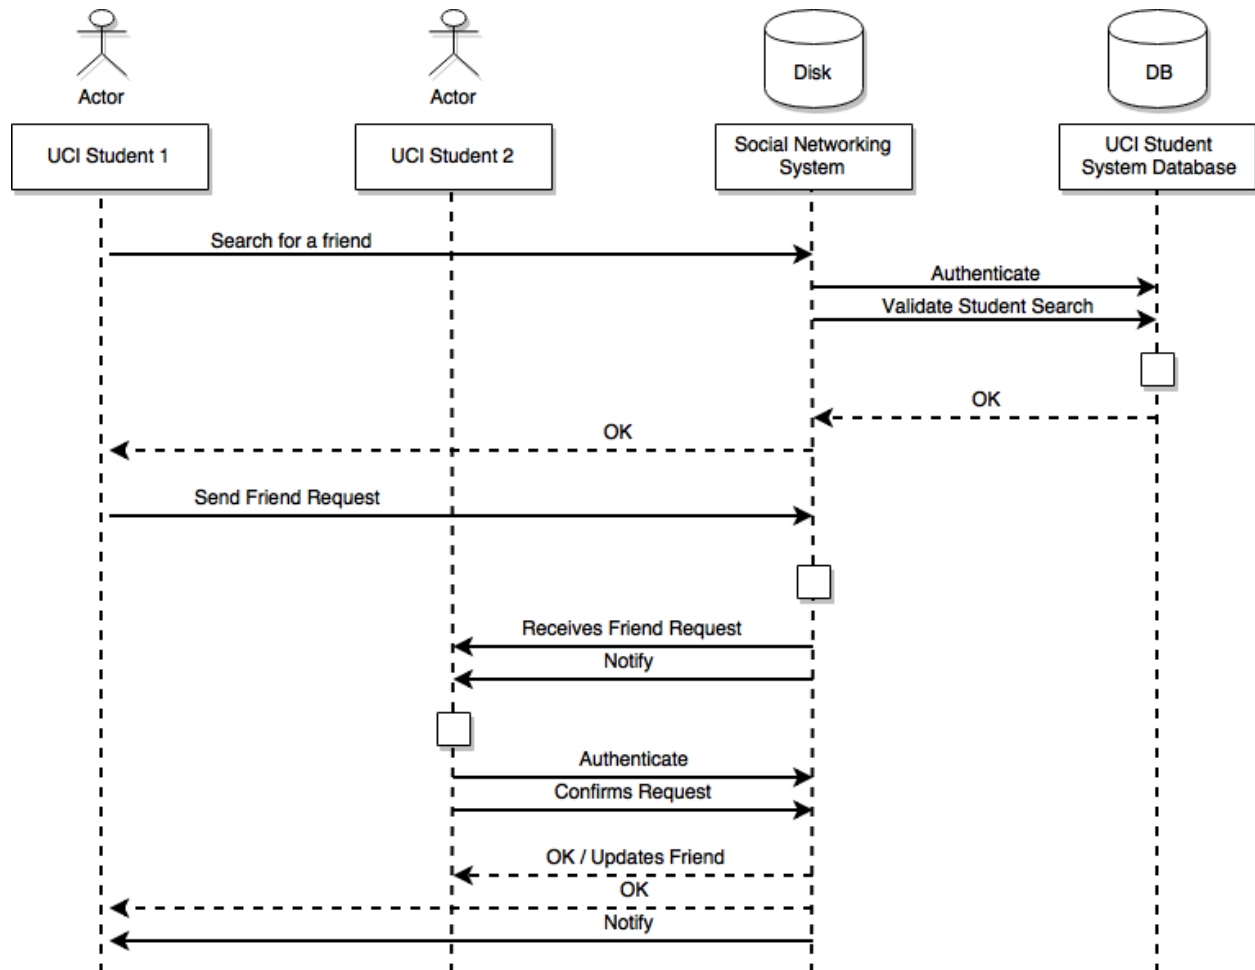

- Coordinator/leader of he and his friends' workout gang
- Lives on campus in the graduate housing dorms
- Always on-time and schedules everything; super organized
- Extremely active on social media
- He often hangs out with his buddies at the ARC when he isn't working on his research projects
- Used the previous ARC app often, but also uses many third-party apps in correlation to keep track of his health/body

Example: Scenario

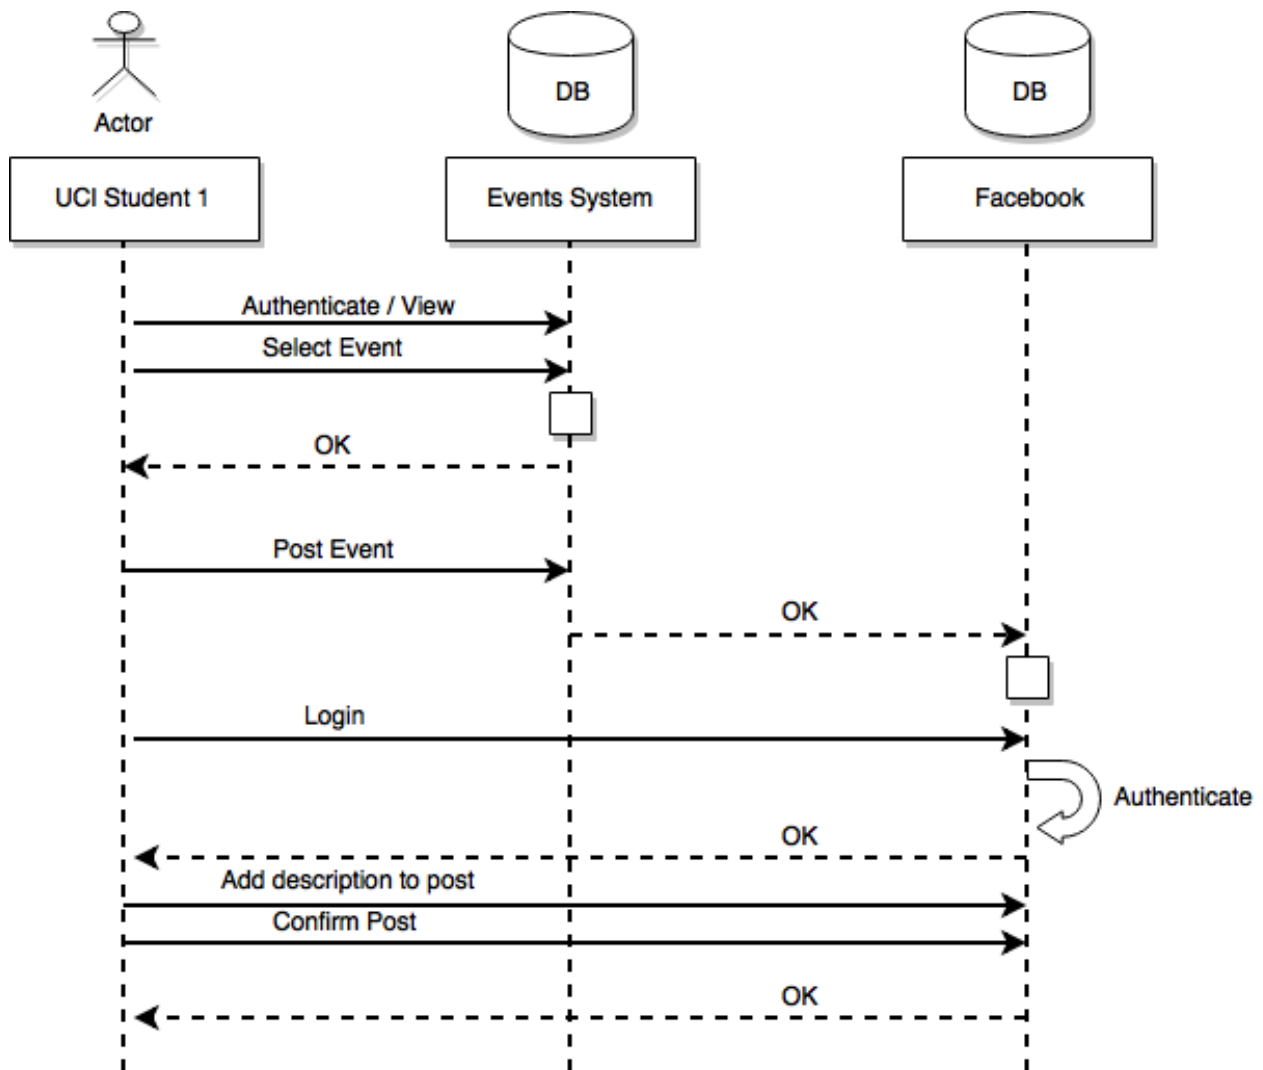

- Anthony just got home from a dinner out with his friends from the University Town Center
- He remembers his best bud asking him when the next group workout is at the ARC
- Anthony, excited to hang out with his best bud soon, grabs his phone and opens the ARCHIE app
- He remembers seeing a cool, free workout session that was going to be taught in a few days and decides to send it to all his friends
- He posts the event to his Facebook group that he made with his workout buddies to notify them if anyone is interested
- The ability to discover events and share them straight to his friends' Facebook group makes Anthony's life much easier as he doesn't have to remember the full details of the events whenever he tells friends
- He also loves the ease of being able to integrate Facebook with the ARC events since it makes it easier to schedule workouts

C. Sequence Diagrams

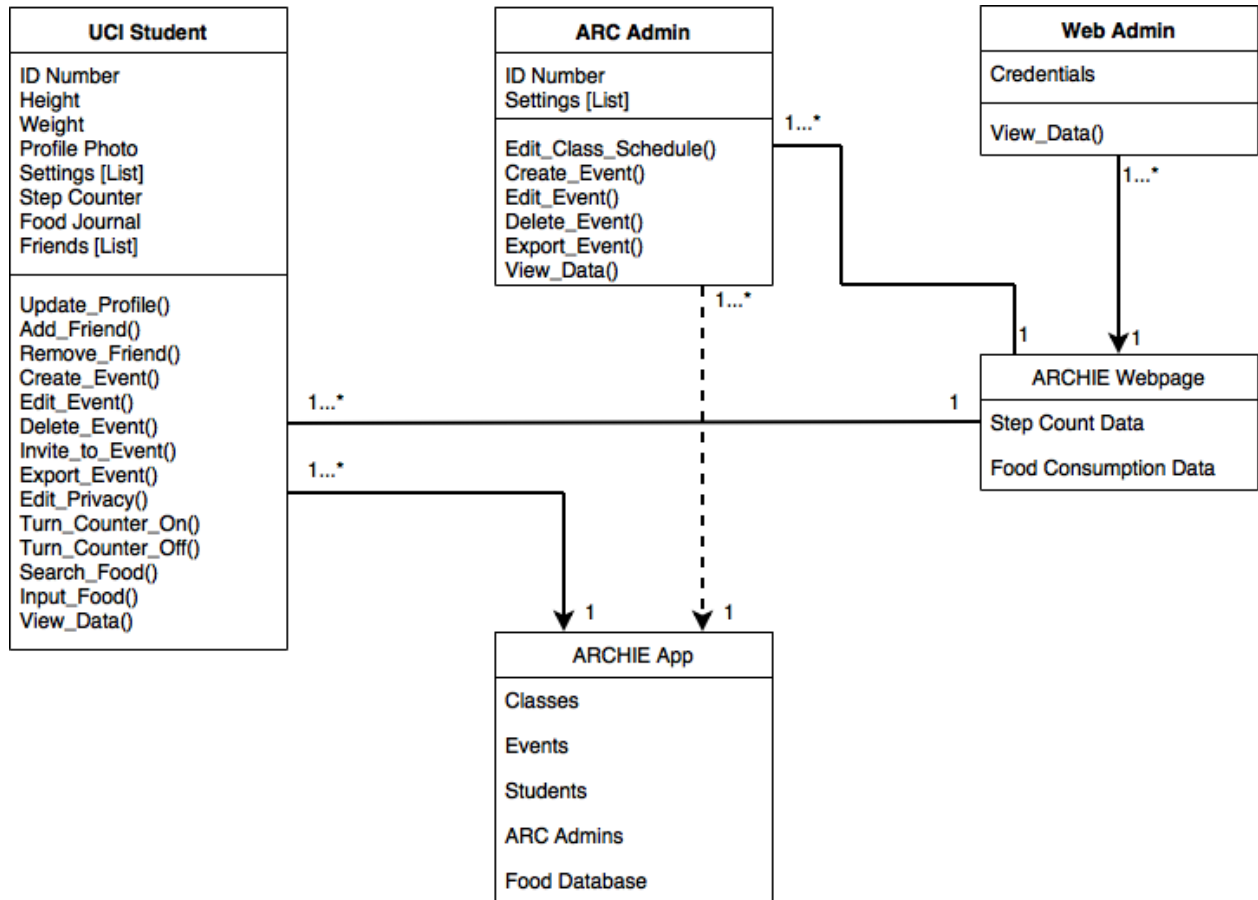

1) UCI Students: Add Friend

2) UCI Students: Export Event to Facebook
